

### Personal Final Reflection.

My personal reflection on the class is that the material turned out to be very complete and enriching. Throughout the course, topics were covered ranging from basic concepts to tools and methodologies that are used in the industry in a professional manner. It was a valuable experience that allowed me to explore everything from the fundamentals of HTML to development with React, server integration, and connecting databases to a web page. In terms of content, I rate the material as excellent due to its relevance and breadth. However, I think some aspects could be improved to optimize the learning experience.

One of the points that I found challenging was the density of the content. In my opinion, the syllabus covered such a broad amount of information that it was often difficult to delve into each topic and retain what I had learned. I often felt that too much material was covered in a single class, making it difficult to properly assimilate and practice the concepts before moving on to the next topic. This accelerated pace, although motivating, could benefit from a better distribution of the content throughout the course. More spaced-out planning with a greater emphasis on practice could facilitate more solid and effective learning for students.

Another point that I consider important is the dynamics of the classes in relation to the resolution of doubts. I noticed that, in general, questions arose after class, when I tried to apply the concepts seen in assignments or projects. During the sessions, by following the examples projected in real time, everything seemed to work smoothly. However, when working on my own, I encountered problems or unclear concepts that were not always taken up in the following class because each session covered a completely new topic. This generated a certain disconnection and the feeling of not having enough time to consolidate the learnings of each module.

Despite these challenges, I want to highlight that I really enjoyed the subject, especially because of the practical approach it had, and in particular, the final project. This project was an excellent way to apply everything learned throughout the course and tangibly evaluate the knowledge acquired. I found it to be a very well-designed activity, which allowed me to integrate the different tools and skills developed during the class. In addition, it was gratifying to see how an abstract concept was transformed into a functional product.

In conclusion, I believe that the subject has great potential and already offers a very solid foundation for students looking to enter web development. With some adjustments in the distribution of content and a deeper focus on resolving doubts, I believe that even more effective learning could be achieved. Personally, I have a positive and enriching experience that I hope to apply in future projects.
