Final Reflection

I really liked this course, because I always wanted to start working on real life projects. Courses like OOP and Advanced programming are great to understand the fundamental of different paradigms of programming, but I didn't see a real-life case where I could use my knowledge on. Now with Web Apps developing I can show to relatives and friends what my job is.

Also, I liked the structure of this course. I felt that every step of this course was big. Every class we learnt a lot, but I felt that, in general, not everyone was understanding everything, and the class was a bit slow because of that. I do feel that needing to read the presentations by myself is a bit annoying to do, but it really helped me. I feel that the teacher should be stricter to make the students read the presentations.

 The exams were also a bit on the hard side, specially in the second term. We only had like 3 days to deliver it and I felt that being in teams chosen by the teacher wasn't the best. I know it was done this way to prevent people choosing their friends. But with so little time, I'd rather work with someone who I already know, than needing to use part of the time of the project to set how we are going to work with the person I don't know.

The project was cool and all, but the instructions were unclear. First the mere selection of the purpose of the project is a bit annoying because we needed to be creative about the UN goal to solve. And then, the features and specifications that the project needed for the result was unclear and we needed to modify a lot to meet expectations.
